Re: LEED Documentation for Bull Moose Tube HSS tubing

Bull Moose Tube Company utilizes steel produced from both the Basic Oxygen Furnace (BOF) process and Electric Arc Furnace (EAF) process in the production of Hollow Structural Section tubes.

Approximately 50% of the HSS Tubing produced at our Elkhart, IN. and Trenton, GA. facilities is from BOF steel coils and 50% is from EAF steel coils.

Approximately 65% of the HSS Tubing produced at our Burlington, ON. facility is from BOF steel coils and 35% is from EAF steel coils.

A Steel Recycling Institute study, in conjunction with a study by Fordham University, calculated the recycled content of steel from BOF mills and EAF mills as follows:

BOF mills:

| | |
|--------------------------------------|-------|
| Total Recycled Content: | 31.7% |
| - - Post-consumer recycled content | 65% |
| - - Post-industrial recycled content | 35% |

EAF mills:

| | |
|--------------------------------------|-------|
| Total Recycled Content: | 95.5% |
| - - Post-consumer recycled content | 60% |
| - - Post-industrial recycled content | 40% |

The above total recycled content conforms to the general experience indicated by our steel suppliers.

I trust this letter provides the information you require.
Should it not, please contact me.
